Canvas-Based Patch Prompt Modifiers

Use the following modifiers to customize how patches are handled inside the canvas-based workflow:

- Show the full patch first for review.

- Only insert after I confirm.

- Apply the patch immediately inside the canvas.

- Before applying, confirm whether the method <methodName>() is used in this file or others.

- Also list any other canvased files that rely on this one.

- Only apply the patch if no breaking changes are detected.

- Apply the patch and show the affected lines with // PATCH START and // PATCH END clearly marked.

- Before patching, check for missing imports or dependencies across canvased files.

- Run a cross-canvas check to confirm all method calls are synchronized.

- List all functions in the file before patching.

- Display the filename and patch summary before inserting anything.
